

ABSTRACT OF THE DISCLOSURE

A photothermographic material comprising at least (a) a photosensitive silver halide, (b) a reducible silver salt, (c) a reducing compound represented by the following general formula (1), and (d) a binder:

wherein, in the general formula (1), Q^1 represents a 5- to 7-membered unsaturated ring bonding to $NH-NH-R^1$ at a carbon atom, and R^1 represents a carbamoyl group, an acyl group, an alkoxy carbonyl group, an aryloxy carbonyl group, a sulfonyl group or a sulfamoyl group, provided that when R^1 is propylcarbamoyl group, Q^1 is not 2,3,5,6-tetrachloro-4-cyanophenyl group. According to the present invention, there is provided a novel photothermographic materials showing high sensitivity, high development speed and little fluctuation of performance due to heat development temperature variation.
